

Lifecycle Methods

Mounting

When an instance of a component is being created and inserted into the DOM

Updating

When a component is being re-rendered as a result of changes to either its props or state

Unmounting

When a component is being removed from the DOM

Error Handling

When there is an error during rendering, in a lifecycle method, or in the constructor of any child component

Lifecycle Methods

Mounting

constructor, static `getDerivedStateFromProps`, `render` and `componentDidMount`

Updating

static `getDerivedStateFromProps`, `shouldComponentUpdate`, `render`, `getSnapshotBeforeUpdate` and `componentDidUpdate`

Unmounting

`componentWillUnmount`

Error Handling

static `getDerivedStateFromError` and `componentDidCatch`

Mounting Lifecycle Methods

`constructor(props)`

A special function that will get called whenever a new component is created.

Initializing state
Binding the event handlers

Do not cause side effects. Ex: HTTP requests

`super(props)`
Directly overwrite `this.state`

Mounting Lifecycle Methods

`constructor(props)`

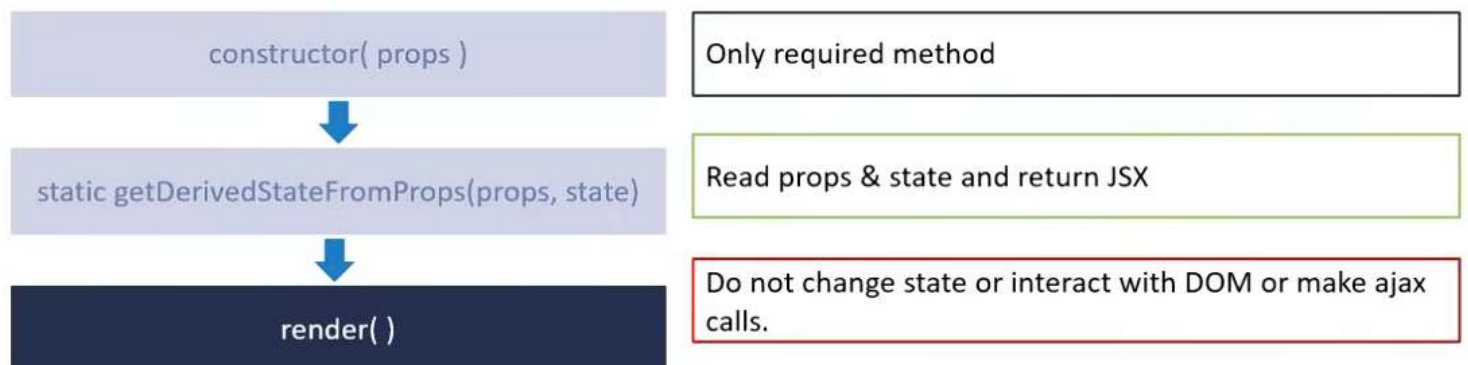

`static getDerivedStateFromProps(props, state)`

When the state of the component depends on changes in props over time.

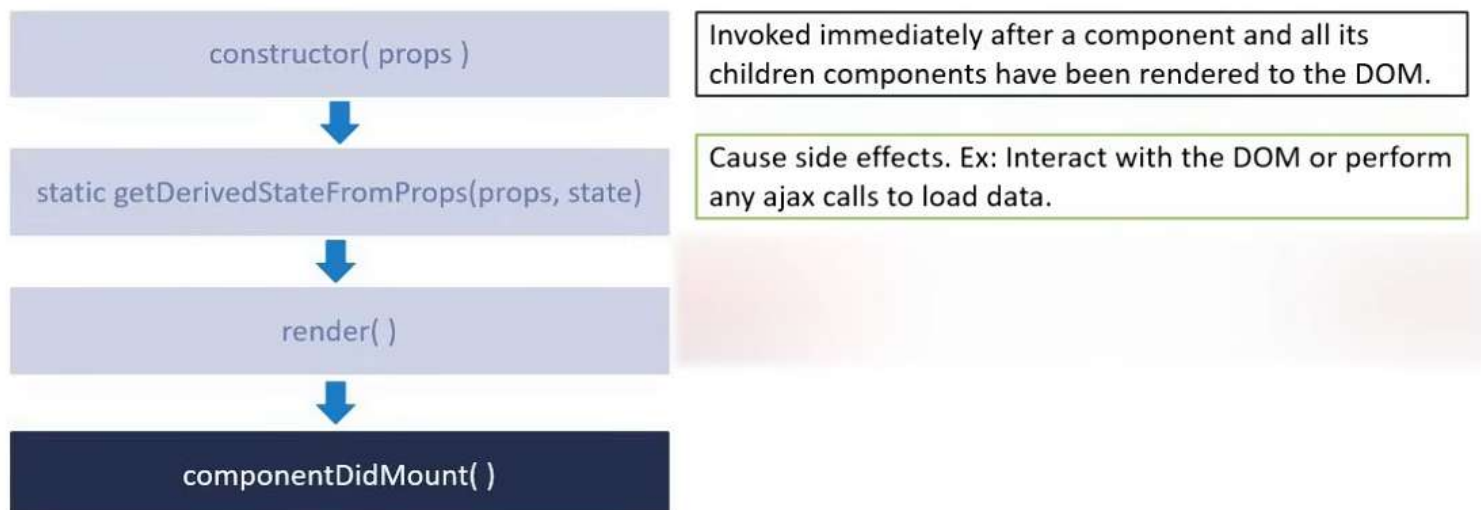

Set the state

Do not cause side effects. Ex: HTTP requests

Mounting Lifecycle Methods

Mounting Lifecycle Methods

Updating Lifecycle Methods

```
static getDerivedStateFromProps( props, state)
```

Method is called every time a component is re-rendered

Set the state

Do not cause side effects. Ex: HTTP requests

Updating Lifecycle Methods

`static getDerivedStateFromProps(props, state)`

`shouldComponentUpdate(nextProps, nextState)`

Dictates if the component should re-render or not

Performance optimization

Do not cause side effects. Ex: HTTP requests
Calling the `setState` method

Updating Lifecycle Methods

`static getDerivedStateFromProps(props, state)`

`shouldComponentUpdate(nextProps, nextState)`

`render()`

Only required method

Read props & state and return JSX

Do not change state or interact with DOM or make ajax calls.

Updating Lifecycle Methods

`constructor(props)`

Called right before the changes from the virtual DOM are to be reflected in the DOM

`static getDerivedStateFromProps(props, state)`

Capture some information from the DOM

`render()`

Method will either return null or return a value. Returned value will be passed as the third parameter to the next method.

`getSnapshotBeforeUpdate(prevProps, prevState)`

Updating Lifecycle Methods

constructor(props)

static getDerivedStateFromProps(props, state)

render()

getSnapshotBeforeUpdate(prevProps, prevState)

componentDidUpdate(prevProps, prevState, snapshot)

Called after the render is finished in the re-render cycles

Cause side effects

Unmounting Phase Method

`componentWillUnmount()`

Method is invoked immediately before a component is unmounted and destroyed.

Cancelling any network requests, removing event handlers, cancelling any subscriptions and also invalidating timers.

Do not call the `setState` method.

Error Handling Phase Methods

```
static getDerivedStateFromError(error)
```

```
componentDidCatch(error, info)
```

When there is an error either during rendering, in a lifecycle method, or in the constructor of any child component.
